Step4) install all packages using pip install -r requirements.txt

Step5) install docker on system

Step6) run this command to run chat server docker run -p 6379:6379 -d redis:5

Step7) now run command python manage.py runserver

Working Demo

This is simple system that allow the user to login and register and create simple post and delete those post and every user can see his post only. Moreover, this system having chat room where any once can enter any room and start chat with each other. This is very basic system and I have not place as much security checks on it and I have provide a simple to get message from database by the room name.
